Golden Line, Spiral, Semicircles at 0°, ±90°, ±180° respectfully

$\frac{\text{Golden Spiral}}{\text{Golden Line}} = \sqrt{2\Phi^{-1}} \text{ or } \sqrt{\sqrt{5}-1}, \quad \frac{\text{Golden Semicircles}}{\text{Golden Line}} = 2\sqrt{\Phi^{-1}} \text{ or } \sqrt{2(\sqrt{5}-1)}, \quad \frac{\text{Golden Semicircles}}{\text{Golden Spiral}} = \sqrt{2}$

If Golden Line = $\sqrt{2}\Phi$ or $\sqrt{3+\sqrt{5}}$, Golden Spiral = $2\sqrt{\Phi}$ or $\sqrt{2(1+\sqrt{5})}$, Golden Semicircles = $2\sqrt{2}\Phi$ or $2\sqrt{1+\sqrt{5}}$

From the vertex of a 2 by 2 unit square, a Golden Line, Spiral, and Semicircles traces out a $\sqrt{2}\Phi^{-1}$ radius circle

Using the Golden Line and knowing the true proportion of π , the length of the Golden Spiral and Semicircles can be derived

If $C : D :: D : P$ whereas $P = 4s$, $s = \sqrt{\frac{\sqrt{\frac{kD}{k} \times \frac{kD}{k}}}{\sqrt{\frac{k\Phi}{k} \times \frac{k\Phi}{k}}}}$, then $\pi : P = 1$, so if $\sqrt{C} : D :: D : \sqrt{P}$ whereas $\sqrt{P} = 4\sqrt{s}$, $\sqrt{s} = \sqrt{\frac{\sqrt{\frac{kD}{k} \times \frac{kD}{k}}}{\sqrt{\frac{k\Phi}{k} \times \frac{k\Phi}{k}}}}$, then $\sqrt{\pi} : \sqrt{P} = 1$, therefore, $\sqrt{\pi} : P :: \pi : \sqrt{P} = 1$

s = side of square

k = total lines filling a directional space

Area of $\sqrt{s}^2 = \sqrt{\sqrt{\sqrt{D^2 \div \sqrt{\Phi^2}}^2}} = \text{quarter circumference as square side} = \sqrt{\sqrt{D^2 \div \sqrt{\Phi^2}}}$

One Circle, Two Squares : [Area Square (Circumference Circle Area] Square Perimeter)

One Square, Two Circles : (Circumference Circle [Area Square Perimeter) Circle Area]

$\square_{\bigcirc} \text{Area} : \bigcirc_{\bigcirc}^{\text{Circumference}} :: \bigcirc_{\bigcirc} \text{Area} : \square_{\bigcirc} \text{Perimeter} :::: \bigcirc_{\square}^{\text{Circumference}} : \square_{\square} \text{Area} :: \square_{\square} \text{Perimeter} : \bigcirc_{\square} \text{Area}$

You can't form the square that inscribes the circle with square approximate π using any point that don't cross the tangent of square approximate π , isn't off the angular line from the center to a circle and square approximate π intersection, and isn't off the 1 unit square side/tangent of circle perpendicular to the tangent of square approximate π

Three points arise from approximate π , only one point arise from the quotient of $\frac{4\sqrt{\sqrt{D^2 \div \sqrt{\Phi^2}}}}{D \text{ as Unit}}$

You cannot use two circles and hide one and claim only one circle's diameter is being used

If $r = 2$, circumference and area of that circle is numerically equal

If $L, W, H = 1$ for formulas below...

$C = \pi 2r = 4\sqrt{\Phi^{-1}}$ $r = D/2$

$D = 2r$ $\pi = C : D$

$A_C = \pi r^2 = \sqrt{\Phi^{-1}}$

The trilemma that you cannot see above zoomed in many, many times below
Approximate π hides its “shadow” and so hides conflicting values
Greater $\pi \approx 3.152494728376...$, Lesser $\pi \approx 3.14159...$

Since the measure of $C : D$ as C/D as $4\sqrt{\Phi^{-1}}$ is only itself hiding no proportion different from itself as a circle or square, it remains to be the true logos of “ π ”

Here lies four examples using greater and lesser approximate π based square perimeter and angle values, none resolves the trilemma

None of the points on the 1 unit square are perpendicular to the tangent of the approximate perimeter square π value

Neither the greater nor the lesser approximate π 's square and angle in relation to the circle has any unique property in relation to the 1 unit square

Only the $4\sqrt{\Phi^{-1}}$ square resolves the trilemma honestly without using any hidden square

True π as constructible incommensurate magnitude of Golden Mean

False π as inconstructible commensurate $n \rightarrow \infty$ sided polygon perimeter

Comparison

Centered True $\pi \perp$ Chord Length = Diameter Length

Offcentered Transcendental $\pi \perp$ Chord Length $<, \neq$ Diameter Length

The true π 's area square's perimeter and area with the true π 's perimeter square's perimeter and area has a unified angular relationship to the Diameter, Circle, and 1 unit square

Clearer visual proof of perpendicular tangents and consistent proportional symmetry for true π

Approximate π does not have this angular relationship with its perimeter or area equivalent both internally and externally

Using the proper angles, new circles and squares can be constructed both inwards and outwards all in perfect constant proportional harmony at any magnitude

Given an equilateral $n \rightarrow \infty$ sided polygon with the same area as the circle, it approximately approaches towards the measure of the circumference of a circle with the same area as the polygon

Circumscribed 1 unit square meets 1 unit diameter circle at four intersections, the square and circle has internally 360° unity with each other, there's one circumscribed polygon with 1 unit perpendicular midline with 1 unit side

Inscribed square area : circumscribed square area = inscribed square area, inscribed square side : circumscribed square side = inscribed square side, no inscribed polygon with 1 unit diagonal with 1 unit side

Using the circumference measure of true π , any sided polygon can be made with the same perimeter to the 1 unit diameter circle's area square perimeter or perimeter square perimeter

However, the area takes precedent over the perimeter or circumference of the polygon or circle as the common unity of the constant of two different ratios of magnitude sharing the same area

Inscribed square area side $\frac{\sqrt{2}}{2} \times$ side $\frac{\sqrt{2}}{2} = \frac{1}{2}$, Circumscribed square area side $1 \times$ side $1 = 1$

1 unit diameter circle area = $\sqrt{\Phi^{-1}}$

Circumscribed triange area $\frac{\text{base}\sqrt{3} \times \text{height} \frac{3}{2}}{2} = \frac{3\sqrt{3}}{4}$, Inscribed triange area $\frac{\text{base} \frac{\sqrt{3}}{2} \times \text{height} \frac{3}{4}}{2} = \frac{3\sqrt{3}}{16}$

Circumscribed pentagon area $\frac{5}{2} \times \text{base}\sqrt{5}\Phi^{-3/2} \times \text{Apothem} \frac{1}{2} = \frac{\sqrt{5} \times 5\Phi^{-3/2}}{4}$

Inscribed pentagon area $\frac{5}{2} \times \text{base} \frac{\sqrt{2(5-\sqrt{5})}}{4} \times \text{Apothem} \frac{\Phi}{4} = \frac{5}{32} \sqrt{2(5+\sqrt{5})}$

Circumscribed triangle to 1 unit diameter circle has sides longer than 1, circumscribed pentagon to 1 unit diameter circle has sides shorter than 1

Any inscribed polygon side is shorter than diameter of 1 unit diameter circle, all inscribed polygons have no direct proportion to the 1 unit diameter circle

Only the circle's area square's perimeter side or the circle's perimeter square's perimeter side is also the value of its area

Quadratrix Curve using True π measure as $4\sqrt{\Phi^{-1}}$ does not negate Φ proportionality

It is not rigorous enough if it works on any substitute measure

After the angular perimeter and area of true π is arrived at, only then can any circle can be drawn using the same circumcenter

in relation to those angles and its intersections on the new circle to make the perimeter or area proportioned square of that new circle
